

iam-jit my [+ new request api github dev REQUESTER log out
requests] tokens

► + NEW REQUEST

Pick how you want to author this role. Both paths run the same risk review and approval flow.

AWS IAM ROLE ACCESS

Already have a policy in hand?
Paste it. Schema validation and
risk review run before submission.

Tip: for the highest-fidelity policies, generate the role locally with a tool like Claude Code that can read your codebase, kubeconfigs, and terraform state – then paste the result here. The hosted iam-jit instance can't see those things by design.

GITHUB REPO ACCESS

Request a scoped, short-lived ($\leq 1h$) GitHub token for specific repositories. Pick the repos and the access level; an approver issues a least-privilege token.

Read clones code; higher levels (open PRs, file issues, push code) are elevations and usually need a prior approval on record.

What iam-jit can see: the policy and description you submit, plus any organization context (account purposes, regions, naming conventions) an admin has provided. **What it cannot see:** your application code, your repositories, kubeconfigs, terraform state, the public internet, or AWS account contents beyond the read-only discovery role (if your admin enabled it). For code-aware policy authoring, run a local agent on your machine and paste the result here.

requests] tokens

► REQUEST GITHUB ACCESS

A scoped, short-lived ($\leq 1h$) GitHub token for specific repositories. An approver reviews it before any token is minted; nothing is issued to repositories you don't list.

GitHub organization / owner

Permissions (pick per category – none / read / write)

PERMISSION	NONE	READ	WRITE
contents repo files / branches / commits (read = clone; write = push)	☐	☒	☐
pull_requests open / comment / review PRs	☐	☐	☒
issues open / comment issues	☒	☐	☐
actions Actions workflow runs + artifacts	☒	☐	☐
workflows add / update .github/workflows files	☒	☐	☐
checks check runs / suites	☒	☐	☐
deployments deployments + statuses	☒	☐	☐
statuses commit statuses	☒	☐	☐
packages GitHub Packages	☒	☐	☐

Advanced (any other GitHub permission, e.g. workflows:write, secrets:read)

workflows:write, environments:read

Duration (minutes, max 60 – GitHub's hard cap)

60

Why do you need this? (optional)

SUBMIT REQUEST

A **read-only** request (every permission set to read) may auto-approve if your admin enabled it. Any **write** permission is reviewed by a human unless you have a prior approval on record for that repository. The token you receive is always freshly minted and ≤ 1 hour.

DESCRIPTION

open a PR fixing the broken build

[OK] GitHub token: ✓ issued. Scoped to web, api (contents:read, pull_requests:write). Expires 2026-06-06T15:34:00Z (GitHub's 1h cap is the hard backstop).

This token is shown **once**. Copy it now – iam-jit does not display it again. You can revoke it early from the actions below.
